AtliQ Hardware

Sales & Financial Analytics (2019–2021)

From Raw Data to Executive Insights

Presenter: Nayan Jyoti Baishya

Project Objective & Scope

Empowering Data-Driven Decisions

Objective

To design and develop a robust reporting system that tracks Atliq Hardware's global sales performance, and financial health.

Scope of Development

Consolidation of multi-year data (2019-2021).

Creation of distinct views for Sales (customer, division, geography, product) and Finance (P&L statements).

Establishment of performance benchmarks against predefined targets.

Data Architecture & Structuring

Building the Foundation

Process

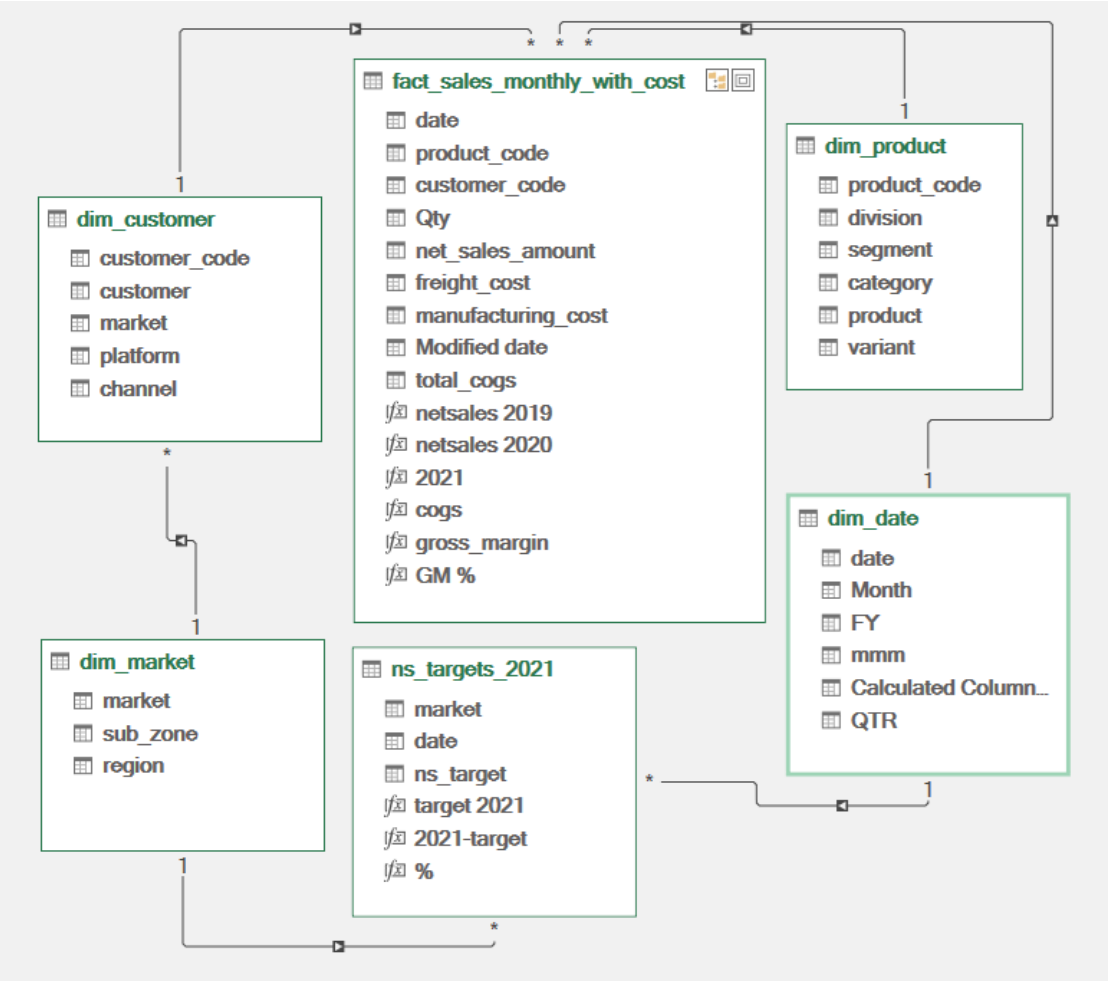
Transformed raw transaction logs into structured datasets suitable for advanced analytics.

Key Dimensions Established

Time Intelligence: Fiscal years, quarters, and monthly granular reporting.

Geographical Mapping: Region, Market, and Country-level hierarchies.

Product Hierarchy: Divisions (N&S, P&A, PC), product categories, and individual SKUs.



Developing the Sales View

Tracking Revenue Drivers

Report Structure

Designed to isolate top-line growth metrics across multiple axes.

Key Reports Developed

Customer Performance: Tracking platform growth (e.g., Amazon, Flipkart, Atliq e-Store).

Division Growth: Year-over-year comparative analysis across PC, P&A, and N&S divisions.

Market vs. Target: A variance analysis report calculating the exact deficit/surplus against 2021 revenue goals.

Developing the Finance View

Architecting the P&L Statements

Report Structure

Built to provide visibility into operational efficiency and profitability.

Key Reports Developed

Net Sales: Deducting discounts and returns from gross revenue.

COGS (Cost of Goods Sold): Tracking the direct costs attributable to hardware production.

Gross Margin (GM) & GM%: Formulated to monitor profitability trends over time, ensuring that volume growth translates to actual business value.

Insight 1 - Explosive Top-Line Growth

Scaling Revenue from 2019 to 2021

The Data

- Net sales grew from **$87.4M** in 2019 to an impressive **$598.8M** in 2021.
- 2021 saw a **~204%** year-over-year growth compared to 2020 ($196.6M).

Takeaway

The company is in a phase of hyper-growth, successfully scaling its operations and market penetration over a three-year window.

Insight 2 - The Profitability Squeeze

Scaling Revenue from 2019 to 2021

The Data

- Despite massive revenue growth, the Gross Margin percentage (GM%) has steadily declined.
- GM% dropped from 41.4% in 2019 to 37.2% in 2020, and further down to 36.4% in 2021.

Takeaway

Cost of Goods Sold (COGS) is rising faster than pricing adjustments can compensate. The company is trading margin for market share.

Insight 3 - Geographic Performance & Missed Targets

Scaling Revenue from 2019 to 2021

The Data

- Top Performers (2021): India leads massively with $161.2M, followed by the USA ($87.7M) and South Korea ($48.9M).
- Target Variance: Several key markets missed their 2021 targets. For example, Canada missed by -$5.06M (-14.4%), and Poland missed by -$940K (-18.1%).

Takeaway

While the absolute numbers in top markets are strong, forecasting and execution in secondary markets require strategic realignment.

Insight 4 - Product Innovation & Volume

The Impact of New Stock Keeping Units (SKUs)

The Data

- New Releases: Products launched in 2021 generated a staggering $176.1M in new revenue (e.g., AQ Qwerty, AQ Trigger).
- Volume Drivers: The "AQ Gamers" and "AQ Master" series dominate in pure unit volume (over 3M-4M units each).

Takeaway

Rapid R&D and new product deployment are critical engines for Atliq's revenue model, successfully capturing consumer interest in the gaming and PC accessory segments.

Strategic Recommendation

Actionable Next Steps

Supply Chain Optimization: Conduct a deep dive into the rising COGS to arrest the declining Gross Margin %.

Target Realignment: Investigate why established markets like Canada and Spain underperformed against their 2021 targets, adjusting sales strategies accordingly.

Portfolio Management: Phase out bottom-performing products (e.g., AQ HOME Allin1 Gen 2) to reallocate manufacturing bandwidth to high-margin or high-volume items.

Thank you
